Final Year Project

Attendance System through Face Detection

- This project is an automated attendance system that uses facial recognition technology to identify individuals and mark their attendance. The system employs computer vision techniques to detect and recognize faces, making the attendance process more efficient, accurate, and secure compared to traditional methods
- Utilizes OpenCV to detect faces in real time through a webcam or camera feed
- A structured database (e.g., SQLite or MySQL) is maintained to store and manage user details (name, ID, and facial data) along with attendance records
